

XactRestore

Your network
already works
in Xactware.
Now you can
see every job.

When a mitigation or restoration job moves to your contractor or managed repair program (MRP) network, what happens next is largely invisible to you. Documentation varies. Status updates arrive in pieces. By the time a job reaches review, the record of what happened onsite is often incomplete, and you're reconstructing it after the fact. XactRestore™ closes that gap—inside the Xactware® ecosystem your organization already runs on.

Built in Xactware, not bolted on

XactRestore is native to Xactware. Field documentation, water mitigation tracking, job management, and communication all live in one place. The data flows cleanly into your organization's estimating and review tools to give you a connected record without adding a new vendor relationship to manage.

XactRestore brings
your network into
a more consistent,
connected way of
working—and delivers
better information
back in return.

What XactRestore means for your claims operation

See the job as it happens

Structured, consistent field documentation means fewer gray areas at review, supplement, and final outcome decisions, and far less time chasing files and context after the fact.

Compare performance on equal footing

Comparable reporting across every contractor and MRP gives your team a clear, side-by-side view of how the network is performing.

Hold the network to one standard

Consistent process execution across distributed contractors and MRPs supports your compliance standards without manual policing.

Reduce cycle time

Your team spends less time chasing updates, files, and missing context as job information becomes more structured.

See what a connected field record looks like for your network.
