

# Statement on Climate Change

At Verisk, we have contributed to the large body of scientific evidence that clearly demonstrates the changes occurring in the Earth’s climate system and the attendant risks to people, property, and financial assets. We are convinced that current trends in global climate change, if left unchecked, will lead to acutely negative consequences, ranging from rising sea levels to the increased frequency and severity of extreme weather and climate events. The result is that future generations, including today’s children, are increasingly likely to experience food and water insecurity, health effects, or climate-related social and economic volatility during their lifetimes.

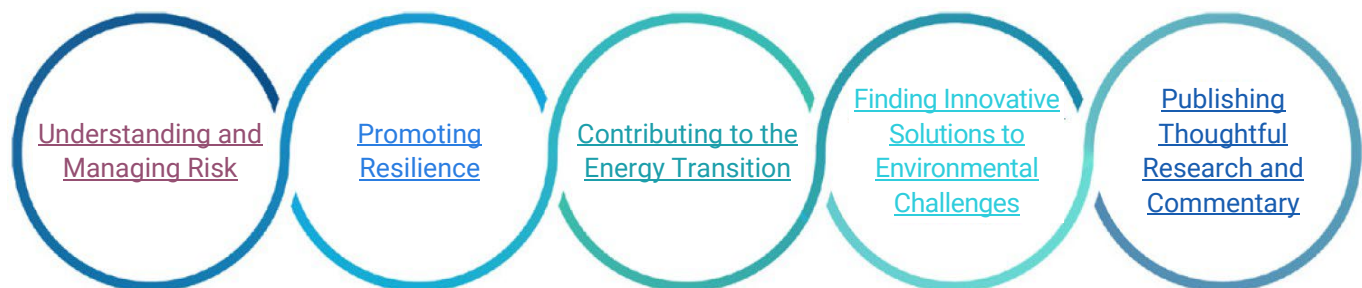

As these threats grow, so does our commitment to help. We work with clients every day to help them understand and manage climate-related risk to their businesses, strengthen mitigation in local communities, and improve resiliency for all. We provide valuable commercial insight and perspective to help them successfully manage and adapt to the evolving challenges associated with the energy transition already underway. We engage with the broader scientific community to find innovative solutions to challenging environmental problems. We publish research and commentary that helps policymakers and business leaders consider the political, social, and economic ramifications of action—and inaction.

We also take responsibility for the impact of our business by monitoring, measuring, disclosing, and reducing emissions associated with our operations. We have and will continue to balance 100% of our CDP-reported emissions through purposeful energy reduction initiatives and investments in renewable energy certificates and carbon offsets. We are further committed to reducing our Scope 1 and 2 greenhouse gas emissions over the long-term in accordance with targets aligned to a 1.5°C future.

With our Board’s active leadership and prudent governance, we continue to invest in the critical infrastructure of our business to support a secure and stable work environment for our employees, the uninterrupted availability of products and services for our customers, and a sustained record of growth and profitability for our investors.

As a business committed to the long-term sustainability of our organization and the global society in which we operate, we remain focused on addressing the very real impacts of climate change today and for the benefit of future generations.
