

Reconstruction cost estimates integrated your way

Driven by demographic shifts, technological advances, and changes in customer expectations, insurers must adapt their insurance quoting methods. From online quoting integration that customers can access on any device to back-end processes easily integrated into your policy management and underwriting systems, Verisk's multiple 360Value® integration options give you reconstruction cost estimates in the way that best meets your business and IT needs.

Embedding 360Value into an online quoting platform

360Value can integrate into a customer-facing web front end that lets home insurance buyers estimate replacement costs as part of an online quoting process. This integration

supports replacement cost estimation on any device, including computers, tablets, and smartphones. You can use the integration for web-based quoting and as the standard 360Value interface for agents, underwriters, and customer service representatives.

360Value integration options provide reconstruction cost estimates in the way that best meets your business and IT needs.

Only Verisk offers this online interface designed with the customer in mind, letting you increase collaboration with homeowners to enhance the customer experience.

360Value Web-Based Application

The standard 360Value user interface can be integrated into any policy management system or accessed as an independent website. You decide the level of integration depending on your business and IT needs. Regardless of your integration level, 360Value makes sure results are based on the latest technology and data. You get the benefit of a simple implementation, and the system provides automatic updates and regular maintenance.

Connect to 360Value through APIs

Insurers that want control over a fully automated underwriting process can implement 360Value web service integration as a back end for your policy management system. You can estimate replacement costs without accessing the 360Value user interface and get agent-gathered property data and 360Value property prefill as needed.

The integration accesses your externally developed user interface to collect construction characteristics and package them through internal servers. Valuation data is sent to 360Value using standard technologies in real time. Replacement cost results are returned in XML, imported into your database, and displayed within your user interface.

Benefits to customers and insurers

No matter which integration option you choose, you and your customers will see solid benefits. Customers will enjoy streamlined experiences, more involvement in the process, and refined replacement costs throughout the life of the policy. Insurers get quick access to replacement cost estimates, seamless integration, and an easy workflow.
